Introduction:

LL(1) Parsing:

Here the 1st **L** represents that the scanning of the Input will be done from Left to Right manner and the second **L** shows that in this parsing technique we are going to use Left most Derivation Tree. And finally, the **1** represents the number of look-ahead, which means how many symbols are you going to see when you want to make a decision.

Essential conditions to check first are as follows:

1. The grammar is free from left recursion.
2. The grammar should not be ambiguous.
3. The grammar has to be left factored in so that the grammar is deterministic grammar.

Algorithm:

Step 1: First check all the essential conditions mentioned above and go to step 2.

Step 2: Calculate First() and Follow() for all non-terminals.

1. **First()**: If there is a variable, and from that variable, if we try to drive all the strings then the beginning Terminal Symbol is called the First.
2. **Follow()**: What is the Terminal Symbol which follows a variable in the process of derivation.

Step 3: For each production $A \rightarrow \alpha$. (A tends to α)

1. Find $\text{First}(\alpha)$ and for each terminal in $\text{First}(\alpha)$, make entry $A \rightarrow \alpha$ in the table.
2. If $\text{First}(\alpha)$ contains ϵ (epsilon) as terminal than, find the $\text{Follow}(A)$ and for each terminal in $\text{Follow}(A)$, make entry $A \rightarrow \alpha$ in the table.
3. If the $\text{First}(\alpha)$ contains ϵ and $\text{Follow}(A)$ contains $\$$ as terminal, then make entry $A \rightarrow \alpha$ in the table for the $\$$.

A figure of LL1 Parser:

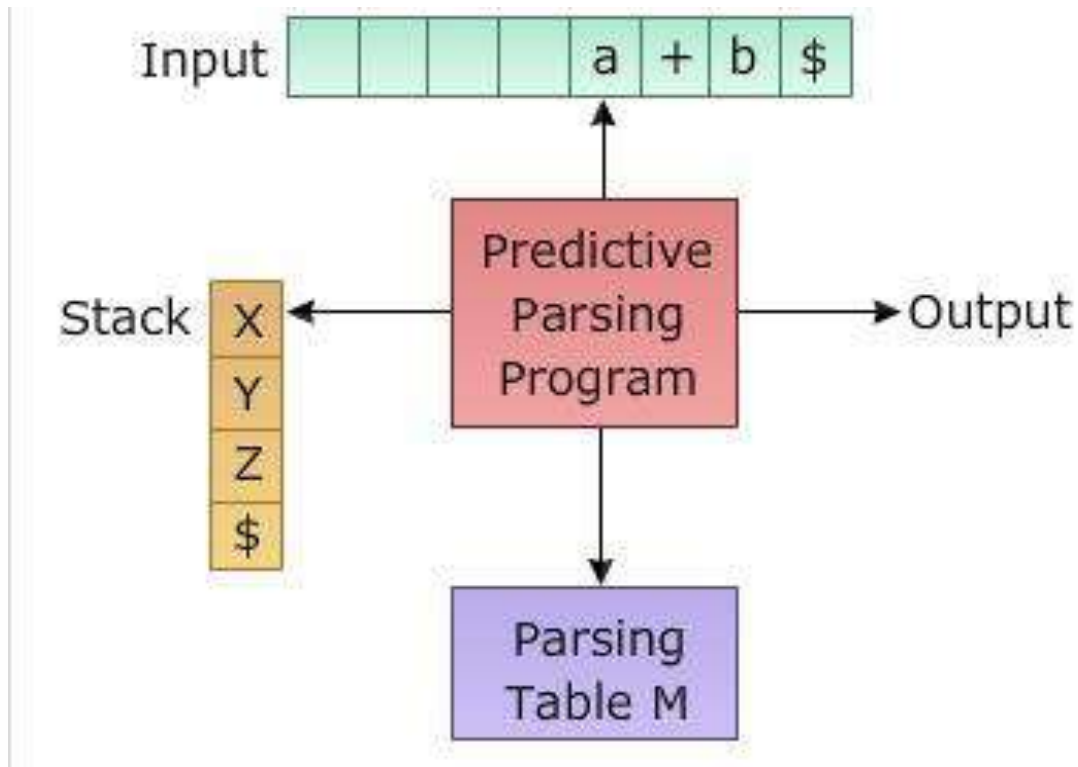

Table:

LL(1) Parsing Table Example

Left-factored grammar

$E \rightarrow T X$
 $X \rightarrow + E \mid \epsilon$
 $T \rightarrow (E) \mid \text{int } Y$
 $Y \rightarrow * T \mid \epsilon$

The LL(1) parsing table

	int	*	+	()	\$
E	TX			TX		
X			+E		ϵ	ϵ
T	int Y			(E)		
Y		*T	ϵ		ϵ	ϵ

End of input symbol

Implementation:

Consider the Grammar:

$E \rightarrow TE'$

$E' \rightarrow +TE' \mid \epsilon$

$T \rightarrow FT'$

$T' \rightarrow *FT' \mid \epsilon$

$F \rightarrow id \mid (E)$

* ϵ denotes epsilon

Step 1 – The grammar satisfies all properties in step 1

Step 2 – calculating first() and follow()

Find their First and Follow sets:

First	Follow	
$E \rightarrow TE'$	{ id, (}	{ \$,) }
$E' \rightarrow +TE'/\epsilon$	{ +, ϵ }	{ \$,) }
$T \rightarrow FT'$	{ id, (}	{ +, \$,) }
$T' \rightarrow *FT'/\epsilon$	{ *, ϵ }	{ +, \$,) }
$F \rightarrow id/(E)$	{ id, (}	{ *, +, \$,) }

Step 3 – making parser table

Now, the LL(1) Parsing Table is:

	id	+	*	()	\$
E	$E \rightarrow TE'$			$E \rightarrow TE'$		
E'		$E' \rightarrow +TE'$			$E' \rightarrow \epsilon$	$E' \rightarrow \epsilon$
T	$T \rightarrow FT'$			$T \rightarrow FT'$		
T'		$T' \rightarrow \epsilon$	$T' \rightarrow *FT'$		$T' \rightarrow \epsilon$	$T' \rightarrow \epsilon$
F	$F \rightarrow id$			$F \rightarrow (E)$		

This grammar is LL1.

So, the parse tree can be derived from the stack implementation of the given parsing table.

Conclusion:

From this report , we came to know about the about introduction , algorithm ,example of LL1 Parser ,how to implement the algorithm .

Most important it's applications and applications .
